## Research Interests

I am currently focusing my research efforts on enhancing the efficiency of testing and debugging large-scale industrial software. To accomplish this objective, I've been actively exploring the following research areas:

- **BIC Identification:** Finding the Bug Inducing Commit (BIC) responsible for observed failures to efficiently assign and fix bugs in software systems involving numerous developers [5, 10]
- **Failure Clustering:** Clustering failures based on their root causes to support the utilisation of automated debugging techniques developed under the single fault assumption [7, 8]
- **Fault Localisation with an Insufficient Test Suite:** Augmenting a test suite with additional test cases that can improve the precision of automated fault localisation techniques [6], Pinpointing the faulty location with just a *single* failed execution using the code understanding capabilities of Large Language Model (LLM) [1]
- **Flaky Failure Detection:** Automatically detecting flaky failures to expedite the continuous integration process and optimise the utilisation of both human and computational resources [2]
