Profile

During my Ph.D., I concentrated on enhancing the efficiency of testing and debugging large-scale industrial software. My research primarily focused on the following areas:

- **BIC Identification**: Finding the Bug Inducing Commit (BIC) responsible for observed failures to efficiently assign and fix bugs in software systems involving numerous developers [10, 15]

- **Failure Clustering**: Clustering failures based on their root causes to support the utilisation of automated debugging techniques developed under the single fault assumption [12, 13]

- **Fault Localisation with an Insufficient Test Suite**: Augmenting a test suite with additional test cases that can improve the precision of automated fault localisation techniques [11], Pinpointing the faulty location with just a *single* failed execution using the code understanding capabilities of Large Language Model (LLM) [7]

- **Flaky Failure Detection**: Automatically detecting flaky failures to expedite the continuous integration process and optimise the utilisation of both human and computational resources [5]

After earning my Ph.D., I joined Roku's Seoul office as a Software Engineer in Test. At Roku, I am involved in developing and maintaining the test automation infrastructure. Roku is the leading TV streaming platform in the U.S., with over 80 million active user accounts.
